

This is the gutter the BUGGED ME! Every fall they would clog up and I would have to clean them out 3-4 times (usually in the rain!)

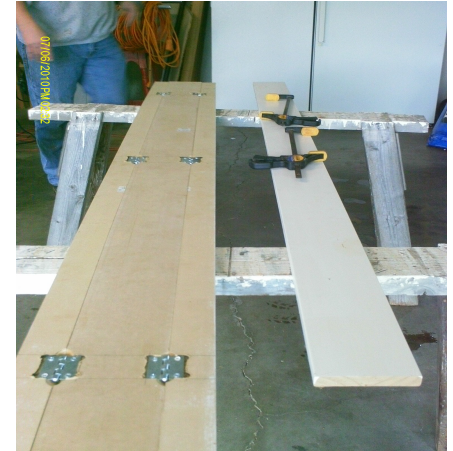

The Problem: Gutters fill up with leaves and don't work properly.

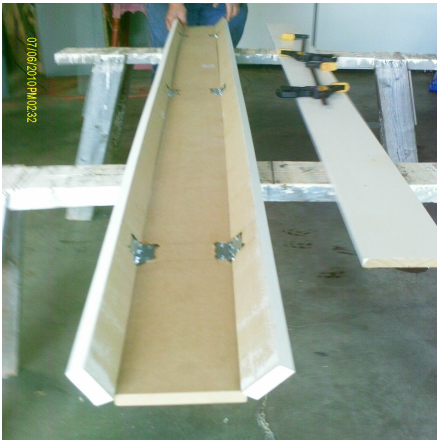

The gutter is cleaned out before placement of the screen.

A fine mesh wire screen is cut into strips.

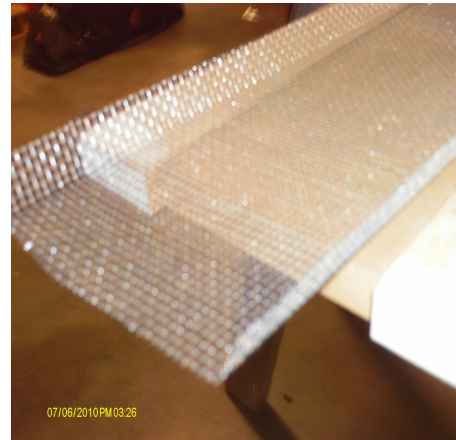

A simple jig is fabricated that makes bending of the screen easy.

The sides fold up to create the bend.

The screen is placed in the jig & another board is added to the top.

The finished screen is removed from the jig.

The screen is installed inside the gutter & the problem is solved!
